"A second t-type isozyme of potato glucan phosphorylase: cloning, antisense inhibition and expression analysis.";
Plant Mol. Biol. 27:567-576 (1995).
-i- FUNCTION: Phosphorylase is an important allosteric enzyme in carbohydrate metabolism. Enzymes from different sources differ their regulatory mechanisms and in their natural substrates.
                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. SUBUNIT: Composed of three subunits: alpha
                                                                                                                                                                                                           FUNCTION: This is the catalytic component of the active enzyme, which catalyzes the hydrolysis of ATP coupled with the exchange of sodium and potassium ions across the plasma membrane. This action creates the electrochemical gradient of sodium and potassium ions,

Genome Biol. 5:RESEARCH008.1-RESEARCH008.16 (2004).

-I-FUNCTION: This is the catalytic component of the active enzyme, which catalytes the hydrolysis of ATP coupled with the exchange of sodium and potassium ions across the plasma membrane. This action creates the electrochemical gradient of sodium and potassium ions, providing the energy for active transport of various nutrients.

-I-CATALYTIC ACTIVITY: ATP + H(2)0 + Na(+)(In) + K(+)(Out) = ADP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE=Placenta;

SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to the cation transport ATP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 providing the energy for active transport of various nutrients. CATALYTIC ACTIVITY: ATP + H(2)O + Na(+)(In) + K(+)(Out) = ADP + phosphate + Na(+)(Out) + K(+)(In). SUBUNIT: Composed of three subunits: alpha (catalytic), beta an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: This is the catalytic component of the active enzyme, which catalyzes the hydrolysis of ATP coupled with the exchange of sodium and potassium ions across the plasma membrane. This action creates the electrochemical gradient of sodium and potassium ions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIMILARITY: Belongs to the ATPases).
